Fast and Easy Analysis

Optical Chip/CAN Device Evaluation

Evaluation systems for optical Chip/CAN devices must support efficient measurements of multiple devices and two key factors are short evaluation time as well as fast optical axis alignment time for each device. For example, irrespective of the LD type, optical axis alignment using MM fiber for receiving radiated light in a short time with good efficiency requires a lot of time consuming work. In this case, the optical spectrum analyzer finally receiving this light must also have the lowest possible connection loss and excellent high-speed sweep performance for waveform analysis. With a built-in Fast mode, the MS9740B supports both a wide dynamic range and high-speed measurement at Rx optical bandwidths (200 Hz and 1 kHz) used most commonly by optical-device production lines. At the same Rx optical bandwidth setting, it retains the same measurement sensitivity as its MS9740A predecessor while cutting measurement times by 50% for better production efficiency. The Multimode Fiber Interface option MS9740B-009 is ideal for evaluating optical devices mainly using this type of MM fiber. The MS9740B-009 optical receiver section is optimized for MM fiber connections. Since extremely accurate sensitivity settings (VBW) are supported, MM fiber connection loss is kept to a minimum and the characteristics of multiple devices can be evaluated efficiently because the optimum sensitivity for level and SMSR measurements as well as high-speed sweeping conditions are both assured. In addition, the MS9740B-009 has high resolution even in the short wavelength band, and offers optimized applications for VCSEL, etc., evaluations.

Optical Spectrum Analyzer MS9740B Various Measurement Applications

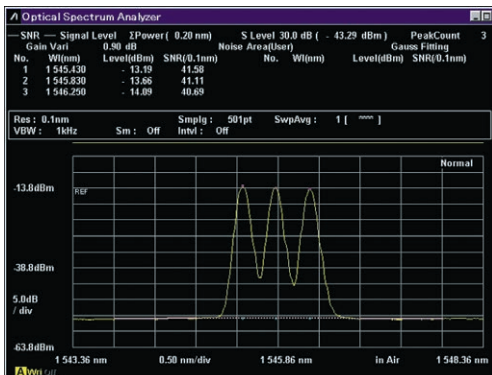

Analyze 100 GHz and 50 GHz Spaced WDM Signal at Once

WDM Application

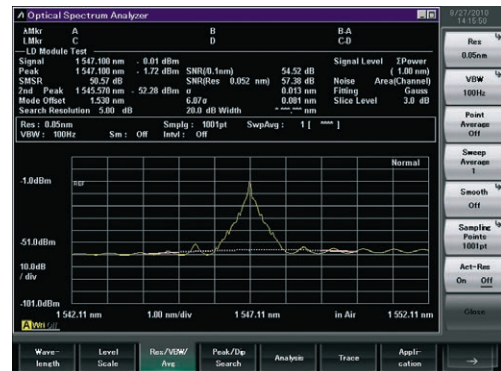

The 42 dB dynamic range at 0.2 nm from the peak wavelength supports accurate WDM signal measurement at 100 and 50-GHz intervals. Up to 300 channels can be evaluated and data required for WDM signal analysis, such as center wavelength, level, SNR, etc., are displayed on one screen. Specification of the noise location, which is required at OSNR analysis, can be selected using two estimation methods; 2-point interpolation, and noise fitting interpolation of a specified noise area. The 2-point interpolation method auto-analyzes the Dip point between each channel, but the distance from the center wavelength can be specified. It can be difficult to estimate noise accurately if the noise is not flat and the edges of the spectrum appear to overlap at adjacent channels. In these cases, accurate OSNR measurement is impossible, but analysis by noise fitting is effective. Either of the two MS9740B noise fitting methods — specification of the noise area for each WDM signal channel, or user-specification of the noise area — can be selected. Sufficient measurement dynamic range must be secured to measure noise position accurately for OSNR measurements. Consequently, a high resolution setting is required, but when measuring the level of a wide spectrum signal with modulation, the level cannot be measured accurately when measuring the spectrum peak at high resolution. To resolve this contradiction, the MS9740B has a built-in signal integration function that accurately measures signal level by integrating the signal even at high resolution.

EDFA Analysis Application

The gain characteristics and Noise Figure (NF) are key optical fiber amplifier performance indices. The MS9740B calculates the gain and NF automatically from the optical input and output to the optical fiber amplifier. It supports two EDFA measurement applications: Opt. Amp (Multi-channel) for WDM signals and the latest IEC standards.

Opt. Amp Application Analysis

The Amplitude Spontaneous Emission (ASE) level is measured either by pulse measurement, interpolation using fitting, or polarization nulling.

Opt. Amp (Multi-channel) Application Analysis

The optical fiber amplifier gain and NF characteristics are different when using a single light source or WDM signals.

When assuming actual WDM transmission, it is extremely important to perform optical fiber amp analysis using a WDM signal as the measurement signal and this EDFA analysis measurement mode supports WDM signals. The IEC-recommended ISS (Interpolated Source Subtraction) method is supported for gain and ASE analysis, and a mode for automatically detecting the noise position is also provided.

The Gain Variation and the Output Slope analysis are also supported within the same application.

Example of Narrow-band Filter Measurement

Narrow-band Filter Analysis using Trace Application

Evaluation of passive devices, such as FBG, AWG, OBPF, etc., uses a wideband light source. The variance between results with and without (reference measurement) the DUT is measured to evaluate the DUT characteristics. The MS9740B has a large waveform memory for saving up to 10 waveforms and a wavelength difference calculation function making it easy to evaluate devices such as optical switches.

Evaluation of passive device also requires a wide dynamic range. The MS9740B is perfect for these evaluations because it has a wide dynamic range of 42 dB at 0.2 nm from the peak wavelength and 58 dB at 0.4 nm from the peak. Moreover, because minimum wavelength resolution is 30 pm and minimum light-reception sensitivity is -90 dBm, the MS9740B can easily evaluate the characteristics of narrow-band filters, etc. In addition, all 10 waveforms displayed on one screen can be saved in one file.

Insertion Loss Evaluation

Filters, such as optical bandpass filters, are evaluated by finding the difference in the measured results when the filter (DUT) is inserted and not inserted. The MS9740B Trace Mode function supports measurement using optical switches to measure DUT insertion loss by inter-waveform processing, saving the results in one file and displaying up to 10 waveforms simultaneously on one screen.

SM/MM Fiber Support

At optical device evaluation and measurement, it is important to suppress the effect of reflections at the optical input section. The MS9740B achieves a reflection attenuation of 35 dB max. using a fiber input structure for high-accuracy spectrum measurement.

The Multimode Fiber Interface option MS9740B-009* option also supports connection of SM fiber.

*: The Multimode Fiber Interface option MS9740B-009 is designed for multimode connections to the optical input section; it supports measurements with high optical sensitivity and high sweep speeds when using a MM fiber with a core diameter of 62.5 μm and an NA of ≤ 0.275 . Although the MS9740B-009 option can also be used to measure SM fiber, some features are different from the standard MS9740B model.

For details refer to the MS9740B and MS9740B-009 specifications.

Various Trace Displays

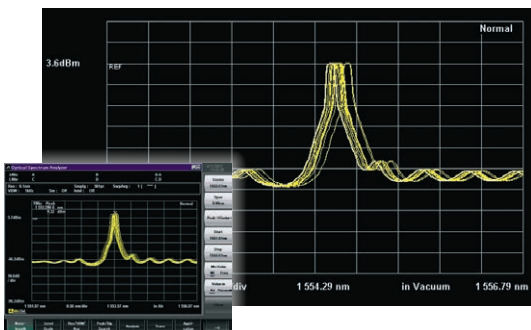

In addition to the normal waveform displays, the MS9740B has a full range of flexible display modes including Max Hold for displaying peak levels at continuous sweeping, Min Hold for displaying dip level at continuous sweeping, Calculate for computing differences between traces, etc.

Max Hold, Min Hold Display Function

These display functions are convenient for confirming maximum and minimum levels at continuous sweeping.

The Overlap function superimposes all swept waveforms on one screen. It is ideal for checking the wavelengths of optical sources and long-term level drift.

Modulated and Pulse Light Measurements

Measurement of modulated and pulsed optical signals requires synchronization with modulation. The trigger input connector on the rear panel of the MS9740B supports input of an external trigger synchronized to the internally modulated light, supporting measurement without data loss.

Wavelength Calibration Function for Accurate Measurements and Analysis

Assuring reliable measurement and analysis requires measurement with the best accuracy and resolution, which in turn requires automatic alignment of the internal optical axis, wavelength calibration with an external light source, and resolution calibration.

A wavelength accuracy of ± 20 pm is assured by calibrating the wavelength using the Light Source for Wavelength Calibration (MS9740B-002) after automatic optical axis alignment.

In addition, the MS9740B has a function for automatically calibrating wavelength if the ambient temperature and pressure change, based on the first calibration data. Calibration of effective resolution is important when measuring the noise level of a continuous spectrum, such as EDFA ASE, LDs, etc.

Item	Calibration
Automatic Optical Axis Alignment	Satisfy wavelength accuracy, level accuracy and dynamic range specifications
Wavelength Calibration	Calibrate wavelength using external light source and light source for wavelength calibration
Actual Resolution Calibration	Calibrate Actual resolution for accurate noise level measurement

*1: The connection loss when connecting 50 μ m/125 μ m multimode optical fiber degrades the minimum light reception sensitivity.
The MS9740B has an MM mode function to correct connection loss when connecting 50 μ m/125 μ m multimode optical fiber and to display the level. The optical loss level is corrected when the MM mode is on. It corrects the level by 14 dB (sum).
Level display errors occur if light is input under other excitation conditions.

*2: Warm-up the instrument for at least 2 hours before measurement by performing repeated sweeping at span ≥ 100 nm, VBW ≥ 10 kHz. Perform waveform calibration after auto-optical alignment (WI Cal) and keep the instrument at the same temperature unless stated otherwise. Use either SM fiber (ITU-T G.652) or GI fiber (50 μ m/125 μ m) with a return loss of >40 dB, or GI fiber (62.5 μ m/125 μ m) with a return loss of >38 dB.

*3: Built-in MS9740B-002, after WI cal (ref) wavelength calibration execution, at stable room temperature

*4: After WI cal (Ext) wavelength calibration execution by external light source, such as Single Longitudinal mode laser (DFB-LD)

*5: Effective resolution, after Res-cal, using SM fiber

*6: Using master FC connector, 23°C ± 5 °C

*7: 10°C to 30°C

*8: When controlling the MS9740B remotely using the Ethernet port, a VISA*9 driver must be installed in the PC controller. We recommend using NI-VISA*10 from National Instruments™ (NI hereafter) as the VISA driver.
Although a license is generally required to use NI-VISA™, the licensed NI-VISA™ driver is provided free-of-charge for use when performing remote control (Note) of a MS9740B unit in which the GPIB option MS9740B-001 has been installed.

The NI-VISA™ driver can be downloaded from the NI website at:

Be sure to comply with the NI license agreement for the usage and license scope.
Be sure to uninstall the NI-VISA™ driver when disposing of the MS9740B or transferring it to a third party, etc., or when ceasing to use NI-VISA™.

(Notes)
Although the NI-VISA™ driver itself can be downloaded free-of-charge from the web, an implementation license is required for legal reasons if some requirements are not met. (Check the NI web page for the detailed requirements.)
If these requirements are not met, permission is not granted to use NI hardware and software and an NI implementation license must be purchased. However, since the GPIB option MS9740B-001 incorporates NI hardware (GPIB ASIC), the NI-VISA™ driver can be used free-of-charge.

Glossary of Terms:
