ShockLine™ Performance Vector Network Analyzers

MS46524B

50 kHz to 43.5 GHz

SHOCKLINE™

Introduction

The MS46524B is part of the ShockLine™ family of Vector Network Analyzers from Anritsu. It is a high performance, 3U tall, 4-port VNA available in three frequency ranges from 50 kHz to 43.5 GHz. It is capable of measuring 16 single-ended and mixed-mode S-parameters of passive multiport and differential devices.

The MS46524B series supports SCPI command programming and has software driver support for the most common programming environments. The MS46524B use industry standard LAN communications for robust remote control in test applications. ShockLine VNAs also provide a powerful graphical user interface for manual testing of devices. The full-featured user interface is enabled by attaching a (user-supplied) touchscreen monitor, keyboard, and mouse.

This document provides detailed specifications for the MS46524B series Vector Network Analyzers (VNAs) and related options.

Instrument Models and Operating Frequencies

Base Model

- MS46524B, 4-Port ShockLine VNA

Requires one Frequency Option

- MS46524B-010, 50 kHz to 8.5 GHz
- MS46524B-020, 50 kHz to 20 GHz
- MS46524B-043, 50 kHz to 43.5 GHz

Principal Options

- MS46524B-002, Time Domain
- MS46524B-022, Advanced Time Domain
- MS46524B-024, Universal Fixture Extraction
- MS46524B-061, Bias Tee (Only available with Option 10)

This technical data sheet applies to the following hardware revisions:
MS46524B base model, revision 4
MS46524B-010 8.5 GHz option, revision 5
MS46524B-020 20 GHz option, revision 5
MS46524B-043 43.5 GHz option, revision 1

All specifications and characteristics apply under the following conditions, unless otherwise stated:

Warm-Up Time	After 45 minutes of warm-up time, where the instrument is left in the ON state.
Temperature Range	Over the 25 °C ± 5 °C temperature range.
Error-Corrected Specifications	Error-corrected specifications are valid over 23 °C ± 3 °C, with < 1 °C variation from calibration temperature. Specifications are warranted and include guard-bands, unless otherwise stated.
User Cables	Specifications do not include effects of any user cables attached to the instrument.
Discrete Spurious Responses	Specifications may exclude discrete spurious responses.
Internal Reference Signal	All specifications apply with internal 10 MHz Crystal Oscillator Reference Signal.
Interpolation Mode	All specifications are with Interpolation Mode Off.
Standard	Refers to instruments with mandatory frequency option only.
Typical Performance	Typical performance indicates the measured performance of an average unit. It does not include guard-bands and is not covered by the product warranty. Typical specifications are shown in parenthesis, such as (-102 dB), or noted as Typical.
Characteristic Performance	Characteristic performance indicates a performance designed-in and verified during the design phase. It does include guard-bands and is not covered by the product warranty.
Recommended Calibration Cycle	12 months (Residual specifications also require calibration kit calibration cycle adherence.)
Specifications Subject to Change	All specifications subject to change without notice. For the most current data sheet, please visit the Anritsu

System Dynamic Range[1]

System dynamic range is calculated as the difference between the test port maximum source power and the RMS noise floor at 10 Hz IF bandwidth with averaging off and smoothing on after calibrating the instrument for transmission frequency response and isolation. Measurement uncertainty and interfering signals must be taken into account when determining effective dynamic range.

MS46524B 8.5 GHz Model

Frequency Range	Standard (dB)	Typical (dB)
50 kHz to 1 MHz	90	101
> 1 MHz to 50 MHz	100	108
> 50 MHz to 2 GHz	140	144
> 2 GHz to 4 GHz	137	142

> 40 GHz to 43.5 GHz	110	120

Receiver Compression Levels

Port power level beyond which the response may be compressed more than 0.2 dB relative to the normalization level. Measured at 300 Hz IF bandwidth. Match not included. Characteristic performance.

Frequency Range	Level (dBm)
50 kHz to 300 kHz	+10
> 300 kHz to 8 GHz[a]	+15
> 8 GHz to 43.5 GHz	+10

a. 8.5 GHz for Option 10

High Level Noise

Measured at 100 Hz IF bandwidth and at default power level, RMS.

Frequency	Magnitude (dB)	Phase (deg)
50 kHz to 300 kHz	0.02 (0.01, typical)	0.15 (0.08, typical)

Measurement Uncertainties

The graphs give measurement uncertainties after the above error-corrected calibration. The errors are a worst-case contribution of residual directivity, load and source match, frequency response and isolation, network analyzer dynamic accuracy, and connector repeatability. 10 Hz IF Bandwidth is used. For transmission uncertainties, it is assumed that $S_{11} = S_{22} = 0$. For reflection uncertainties, it is assumed that $S_{21} = S_{12} = 0$. All calibrations and measurements were performed at 0 dBm or default port power, whichever is less. Standard Capabilities

Operating Frequencies

MS46524B-010	50 kHz to 8.5 GHz
MS46524B-020	50 kHz to 20 GHz
MS46524B-043	50 kHz to 43.5 GHz

Measurement Parameters

4-Port Measurements	16 single-ended S-parameters, and any user-defined combination of a_{1-4}, b_{1-4}, and 1. 16 mixed-mode S-parameters (DD, CC, DC, CD); uses the superposition technique Maximum Efficiency Analysis
Domains	Frequency Domain, Time (Distance) Domain (Option 2), Power Domain

Sweeps

Sweep Configurations	Standard or Simultaneous (MS46524B-010 option only)
Frequency Sweep Types	Linear, Log, CW, or Segmented
Power Sweep Types	Linear

Display Graphs

Single Rectilinear Graph Types	Log Magnitude, Phase, Group Delay, Linear Magnitude, Real, Imaginary, SWR, Impedance, KQ and η Max
Dual Rectilinear Graph Types	Log Mag and Phase, Linear Mag and Phase, Real and Imaginary, KQ and η Max
Circular Graph Types	Smith Chart (Impedance), Polar

Measurements Data Points

Maximum Data Points	2 to 20,001 points

Limit Lines

Limit Lines	Single or segmented. 2 limit lines per trace. 50 segments per trace.
Single Limit Readouts	Uses interpolation to determine the intersection frequency.
Test Limits	Both single and segmented limits can be used for PASS/FAIL testing.

Ripple Limit Lines	
Limit Lines	Single or segmented. 2 limit lines per trace. 50 segments per trace.
Ripple Value	Absolute Value or Margin
Test Limits	Both single and segmented limits can be used for PASS/FAIL testing.
Averaging	
Point-by-Point	Point-by-point (default), maximum number of averages = 4096
Sweep-by-Sweep	Sweep-by-sweep, maximum number of averages = 4096
IF Bandwidth	10, 20, 30, 50, 70, 100, 200, 300, 500, 700 Hz 1, 2, 3, 5, 7, 10, 20, 30, 50, 70, 100, 200, 300, 500 kHz
Reference Plane	
Line Length or Time Delay	The reference planes of a calibration or other normalization can be changed by entering a line length or time delay.
Dielectric Constants	Dielectric constants may be entered for different media so the length entry can be physically meaningful.
Dispersion Modeling	Dispersion modeling is used in the cases of microstrip and waveguide to take into account frequency dependent phase velocities.
Attenuation	Attenuation (with frequency slope) and constant phase offsets can be entered to better describe any reference plane distortions. The frequency dependence exponent is changeable.
Auto Modes	Automatic reference plane finding tools are available for phase alone or phase + magnitude. These routines do a fitting process on phase or phase and magnitude to estimate the reference plane location and enter correcting values.
De-embedding	For more complete reference plane manipulation, the full de-embedding system can also be used.
Measurement Frequency Range	
Frequency Range Change	Frequency range of the measurement can be narrowed within the calibration range without recalibration.
CW Mode	CW mode permits single frequency measurements also without recalibration.
Interpolation Not Activated	If interpolation is not activated, the subset frequency range is forced to use calibration frequency points.
Interpolation Activated	If interpolation is activated, any frequency range that is a subset of the calibration frequency range can be used, but there may be some added interpolation error.
Group Delay	
Group Delay Aperture	Defined as the frequency span over which the phase change is computed at a given frequency point.
Aperture	The aperture can be changed without recalibration.
Minimum Aperture	The minimum aperture is the frequency range divided by the number of points in calibration and can be increased to 20 % of the frequency range.
Group Delay Range	< 180° of phase change within the aperture
Channels, Display, and Traces	
Channels and Traces	16 channels, each with up to 16 traces
Display Colors	Unlimited colors for data traces, memory, text, markers, graticules, and limit lines
Trace Memory	Up to 20 trace memories are available per channel to store measurement data for later display or comparison with current measurement data. The trace data can be saved and recalled.
Trace Math	Any two traces within the same or different channels can be combined (via addition, subtraction, multiplication, or division) and displayed on another trace. An equation editor mode is also available that allows the combination of trace data, trace memory and S-parameter data in more complex equations. Over 30 built-in functions are available. Simple editing tools and the ability to save/recall equations are also provided.
Scale Resolution	Minimum per division, varies with graph type.
Log Magnitude	0.001 dB
Linear Magnitude	10 μU
Phase	0.01°
Group Delay	0.1 ps
Time	0.0001 ps
Distance	0.1 μm
SWR	10 μU
Power	0.001 dB
Markers	
Markers	12 markers + 1 reference marker per trace
Marker Coupling	Coupled or decoupled
Marker Overlay	Display markers on active trace only or on all traces when multiple trace responses are present on the same trace
Marker Data	Data displayed in graph area or in table form
Reference Marker	Additional marker per trace for reference
Marker Statistics	Mean, maximum, minimum, standard deviation Per trace or over a marker region
Marker Search and Tracking	Search and/or track multiple ranges for minimum, maximum, peak, or target value. Multiple marker search ranges per trace are available.

Other	Filter Parameters	Display bandwidth (user-selectable loss value), corner and center frequencies, loss, Q, and shape factors.
	S-Parameter Conversion	Z Reflection Impedance Z Transmission Impedance Y Reflection Admittance Y Transmission Admittance 1/S

Calibration and Correction Capabilities

Calibration Methods	
	Short-Open-Load-Through (SOLT) Short-Open-Load-Reciprocal (SOLR) Offset-Short-Offset-Short-Load-Through (SSLT) Triple-Offset-Short-Through (SSST) Line-Reflect-Line (LRL) / Line-Reflect-Match (LRM) Thru-Reflect-Line (TRL) / Thru-Reflect-Match (TRM) Source Calibration Receiver Calibration SmartCal™ AutoCal™ Thru Update available Secondary match correction available for improved low insertion loss measurements
Correction Models	
	4-port Cals (uses two Full 2-port Cals and up to 4 additional Thru/Reciprocals, minimum of 1) 3-port Cals (uses one Full 2-port Cal, one Full 1-port Cal, and up to 2 additional Thru/Reciprocals, minimum of 1) 2-Port (Forward, Reverse, or both directions) 1-Port (S_{11}, S_{22}, or both) Transmission Frequency Response (Forward, Reverse, or both directions) Reflection Frequency Response (S_{11}, S_{22}, or both)
Coefficients for Calibration Standards	
	Use the Anritsu calibration kit USB memory device to load kit coefficients and characterization files. Use predefined coefficients for Anritsu calibration kits in ShockLine software. Enter coefficients into user-defined locations. Use complex load models.
Interpolation	Allows interpolation between calibration frequency points.
Adapter Removal Calibration	Characterizes and "removes" an adapter that is used during calibration that will not be used for subsequent device measurements; for accurate measurement of non-insertable devices.
Dispersion Compensation	Selectable as Coaxial, other non-dispersive (e.g., for coplanar waveguide), Waveguide, or Microstrip.
Power	
Power Meter Correction	Different power meter calibrations are available to enhance power accuracy at the desired reference plane. The source power will match the target calibration power, as read by the power meter, to within ~0.1 dB for short periods of time (determined by thermal drift of the system and the power meter). The absolute accuracy of the calibrated power will be dependent on the power meter and sensor used.
Flat Power Calibrations	A flat power calibration (when in frequency sweep mode) is available at a user-selectable power level, if it is within the power adjustment range of the internal source. The flat power correction is applied to other power levels.
Linear Power Calibrations	A linear power calibration is performed over a range of power levels for use in power sweep mode and is performed at a specified frequency or frequency range.
External Power Meter	Both calibrations are performed using an external USB power sensor (Anritsu MA24106A, MA24108A, MA24118A, MA24126A, MA24330A, MA24340A, MA24350A) over a USB 2.0 port.
Embedding/De-embedding	The MS46524B is equipped with an Embedding/De-embedding system.
De-embedding	De-embedding is generally used for removal of test fixture contributions, modeled networks, and other networks described by S-parameters (s2p files) from measurements.
Embedding	Similarly, the Embedding function can be used to simulate matching circuits for optimizing amplifier designs or simply adding effects of a known structure to a measurement.
Multiple Networks	Multiple networks can be embedded/de-embedded and changing the port and network orientations is handled easily.
Extraction Utility	An extraction utility is part of this package that allows easier computation of de-embedding files based on additional calibration steps and measurements.
Optical/Electrical Conversion	
O/E, E/O, & O/O	O/E, E/O, and O/O setup wizards are provided.
Impedance Conversion	Allows entry of different reference impedances (complex values) for different ports.

Optional Capabilities

Time Domain Measurements, Option 2	Displays all S-parameters and overlays with Frequency Domain, Low-pass Mode with added harmonics frequency list flexibility, Band-pass Mode, Phasor Impulse Mode, Windowing, Gating (pass-band or reject-band), and Frequency with Time Gate.
Advanced Time Domain Measurements, Option 22	The ATD option has two basic elements. The first element is an Eye Diagram automatically created from a stored .SnP data file after launching the ADK software. The second element accesses the following functions: Check Passivity and Causality, Combine .SnP Files, Plot Eye Diagram, Plot Crosstalk, Plot TDT/TDR/Skew, and Perform Compliance Test. Option 2 recommended with Option 22, but is not required.
Universal Fixture Extraction, Option 24	Provides a suite of additional network extraction techniques for different de-embedding problems, particularly those when only partial interface information is available at the DUT plane. These are often useful for on-wafer and fixtured environments with more complex DUT interfaces where traditional standards may not be available. In most cases, .s1p definition/model of reflect standards is allowed and generally automatic fixture length detection is available. In addition, a sequential extraction (peeling) of isolated fixture defects is possible and allows one to generate sNp files for portions of the fixture for design analysis.

Remote Operability

ShockLine supports several remote operability options.

Communication Type	Data Format	Performance	Description
Via LAN	Using VXI-11 Protocol	Gigabit Data Transfer Speed	Use SCPI commands
Drivers for LAN	IVI-C drivers are available for download from the Anritsu website. The IVI-C package supports National Instruments LabVIEW and LabWindows, C#, .NET, MATLAB, and Python programming environments.
